

SentinelLM 7.1 and SentinelExpress

Software Distribution, Licensing and Electronic Commerce

SentinelLM is easy to use. Licensing can be added with a "point and click." Tutorials with examples make learning the product a breeze.

SentinelLM/Express Benefits:

- Secures applications from unauthorized execution
- Protects developers and ISVs from illegal licensing
- Secures applications and their derivative information
- Offers customized software packages to customers

Rainbow: Software Security

Rainbow provides the world's leading solutions for secure software licensing, distribution, electronic commerce, and user authentication.

Rainbow's Sentinel product family enables eCommerce for ISVs, software developers, and ASPs by providing Internet-based software distribution and management tools (SentinelLM and SentinelExpress) for global corporations. Sentinel also secures applications from unauthorized execution and protects developers and ISVs from illegal licensing and distribution.

Rainbow's Sentinel solutions provide the tools to enable:

- Digital Rights Management (DRM)
- Electronic License Distribution and Management (ELD/M)
- Electronic Software Distribution (ESD)
- Electronic Commerce Licensing Tools and Security

Securely Distribute and License Software with SentinelLM/Express

Securely distribute and license software via the Internet to accelerate the distribution process, manage licensing, and support rapid deployment. SentinelLM is a secure solution for managing, controlling and administering software distribution, updates, new releases, and patches. SentinelLM will also prevent unauthorized execution of software by securing applications and their derivative information, and provides software developers with license protection from illegal distribution.

SentinelLM offers a wide range of possible configurations to protect and distribute an application. These include concurrent, standalone, multiple locking, time-limited, trial, commuter, and site-licensed set-ups. With the help of the supplied Application Programming Interface (API), developers can easily integrate to control access and protect against illegal operation of executable code. Or, apply the SentinelLM-Shell utility program to protect compiled programs automatically.

SentinelLM is internationalized to support multiple languages, handle client/server communications in multiple languages, display dates and times in the correct format for the specified geographical locale, handle multi-byte text and other considerations. The software and manuals are available in English, French, Spanish, Traditional Chinese, and Simplified Chinese.

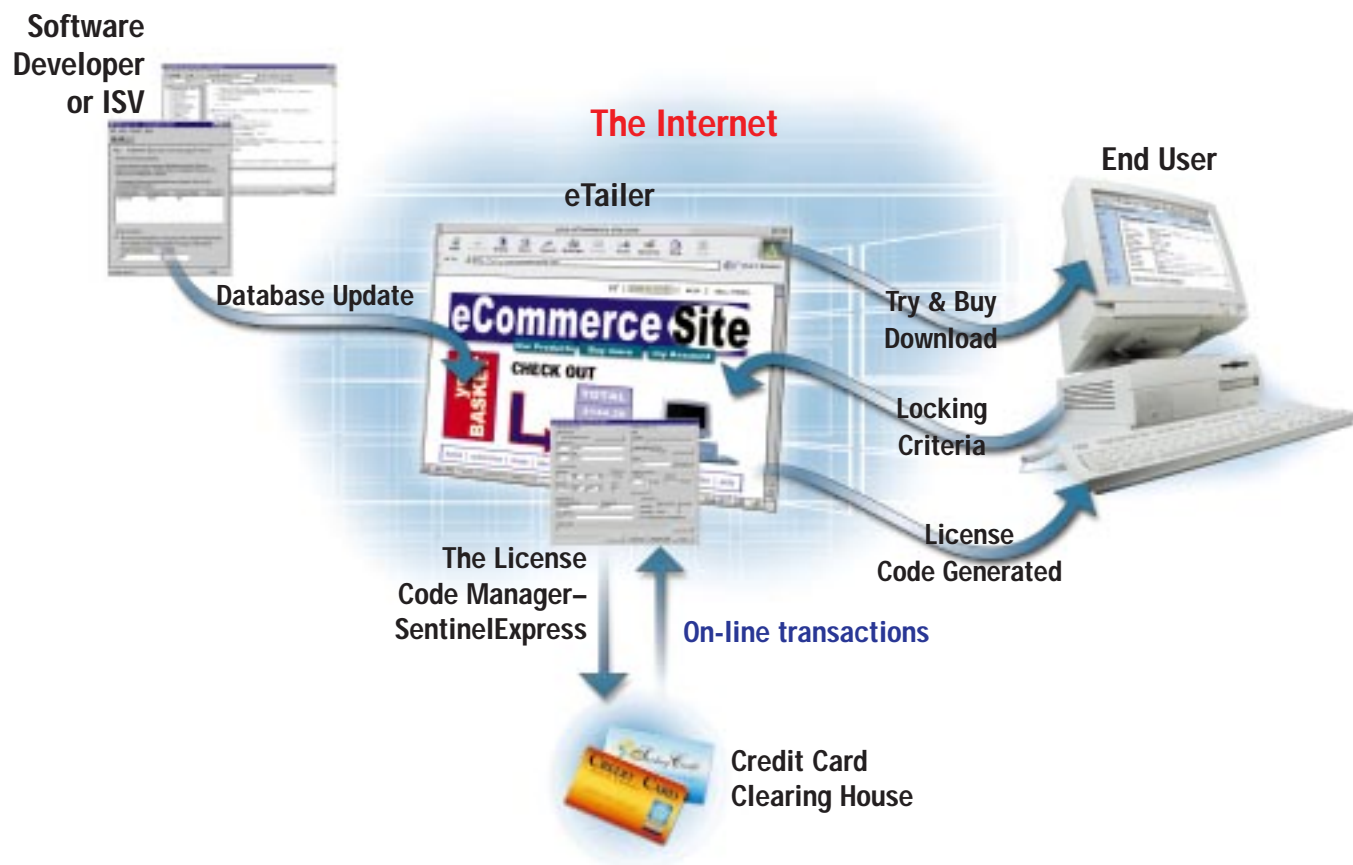

For more information on SentinelLM, call us in the U.S. today at 1-800-852-8569.

SentinelLM 7.1 and SentinelExpress

As a software developer or ISV, you need the ability to sell your software quickly and securely. SentinelLM/Express allows you to accomplish this by taking advantage of the Internet for electronic software distribution (ESD) and software licensing and management. The SentinelLM suite puts your product in your customers' hands immediately, while encouraging licensing compliance and reducing theft.

Protection and Distribution of an Application

After protecting an application, it can then be added to a Web site for distribution. The end user selects a software package, which they would like to purchase. It is then downloaded through SentinelExpress, which performs the secure payment authorization. Once the payment is successfully processed, the end user submits a locking code to the eTailer. From this, SentinelLM generates a license code, which defines the end user's usage of the application. The license code is placed on a license page, or it can be distributed via the Client Activator. The license code is then entered into the installer, which grants the end user authorization to use the application.

Specifications:

Standard Platforms:

- Windows NT Client/Server 4.0 or later & Windows 95/98/2000
- Sun Solaris 7, 8
- HP-UX 11.0 (32-bit)
- UNIXWare 7
- SGI IRIX 6.x (n32) (o32)
- IBM AIX 4.3.3, 4.3.2
- HP-UX 10.20 (32-bit)
- Linux Redhat 6.x
